Simulations for the campaign of AGATA at GSI (brief summary on geometry aspects)

César Domingo Pardo

GSI Helmholtzzentrum für Schwerionenforschung

Outline

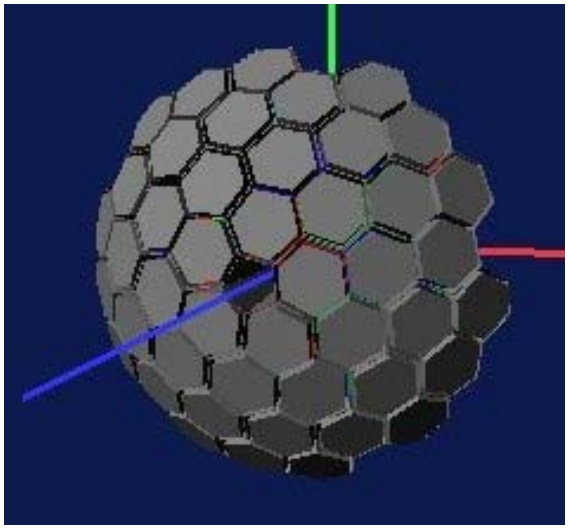
- Summary about previous status
- Geometries: shell and compact setups
- Performance comparison
- Viability of additional γ-ray detectors: RISING, HECTOR, etc
- Gain in performance from 10 to 12 Clusters
- Outlook and conclusion

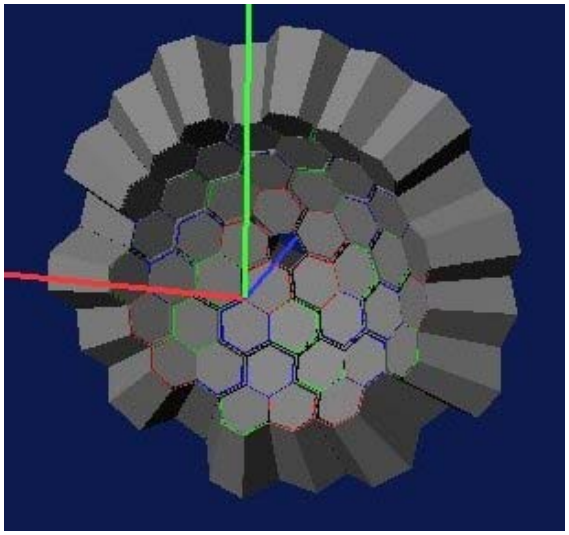
Outline

- Particular constraints for the setup at GSI
- Geometries: shell and compact setups
- Performance comparison
- Viability of additional γ-ray detectors: RISING, HECTOR, etc
- Gain in performance from 10 to 12 Clusters
- Outlook and conclusion

Particular constraints for the setup at GSI

- Ideal geometry (first approach, first step)





- two main constraints:

1. 15 cluster detectors will not be available yet in 2011/2012 (10-12 instead)
2. The beam hole (pentagon) is too small for the GSI beam size

- General geometry constraint: triple clusters (not single)

Particular constraints for the setup at GSI

- Ideal geometry (first approach, first step)

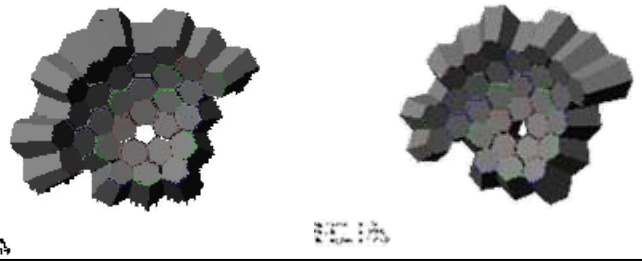
- Gain in performance from 10 to 12 Clusters
- Outlook and conclusion

Shell geometries

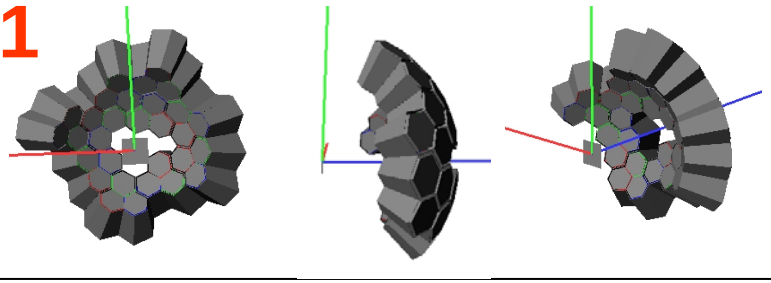
more realistic



10 Clusters

Hole too small (appx. 4 cm)

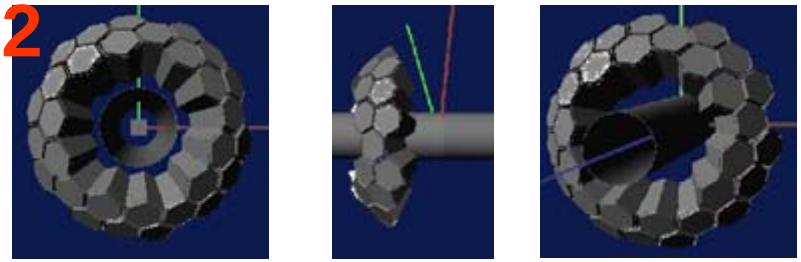
S1



10 Clusters (Hole 1 Cluster)

Hole small (appx. 7 cm)

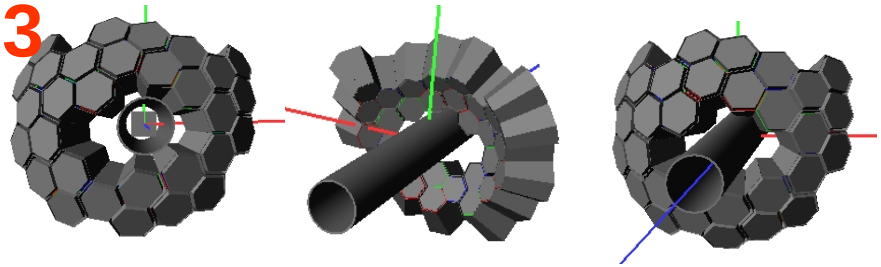
S2



10 Clusters (Hole 5 Clusters)

Hole (22.8 cm) beam-pipe 16 cm

S3

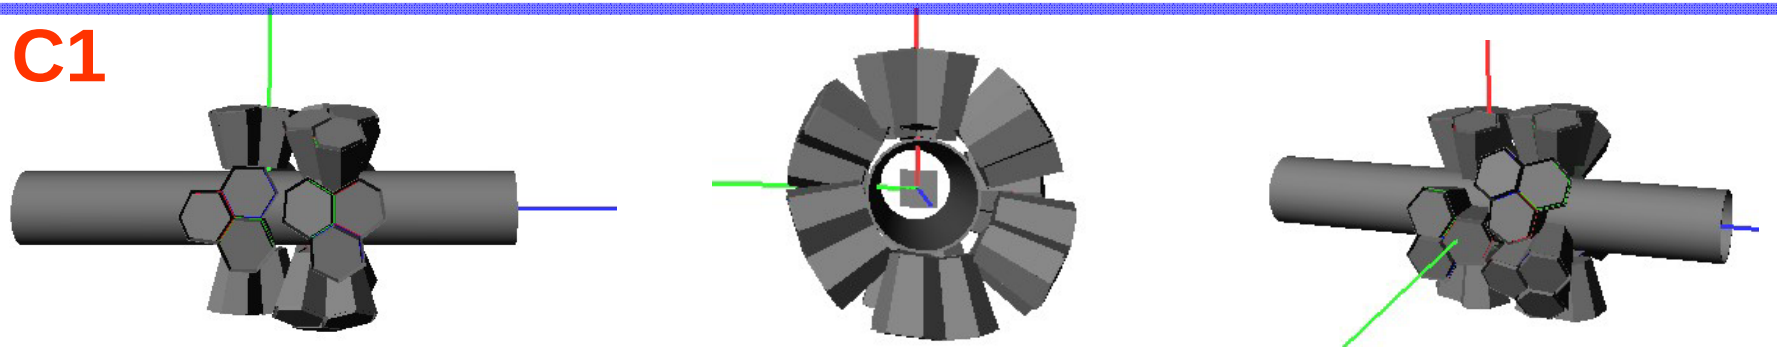


10 Clusters (Hole 2 Clusters)

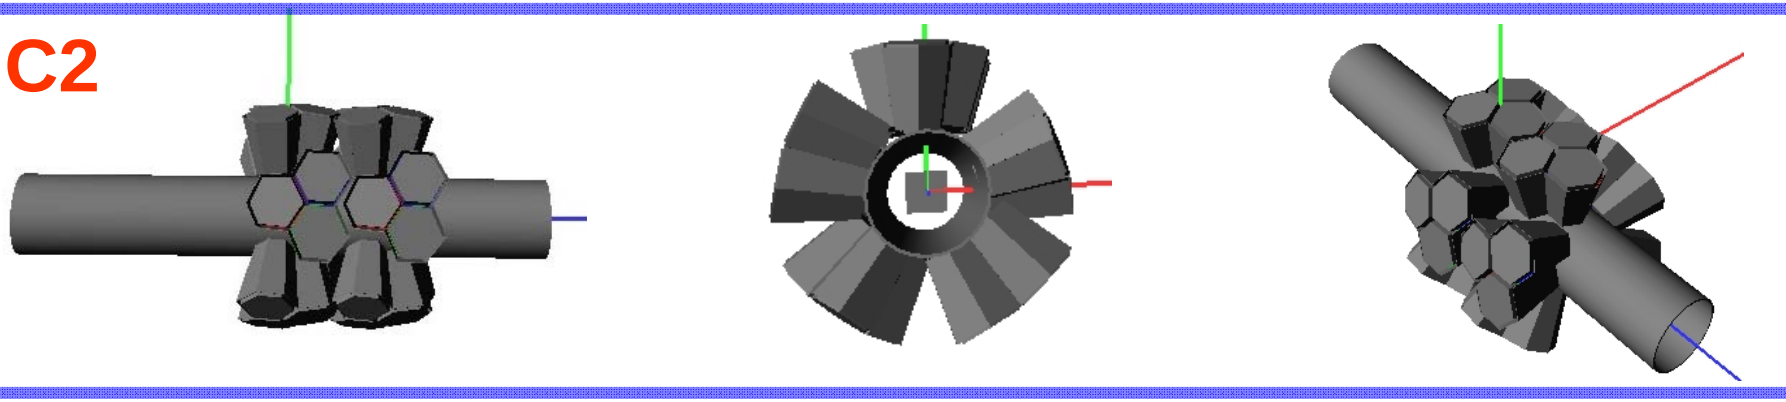
Hole (11.5 cm) beam-pipe **11 cm**

Compact geometries

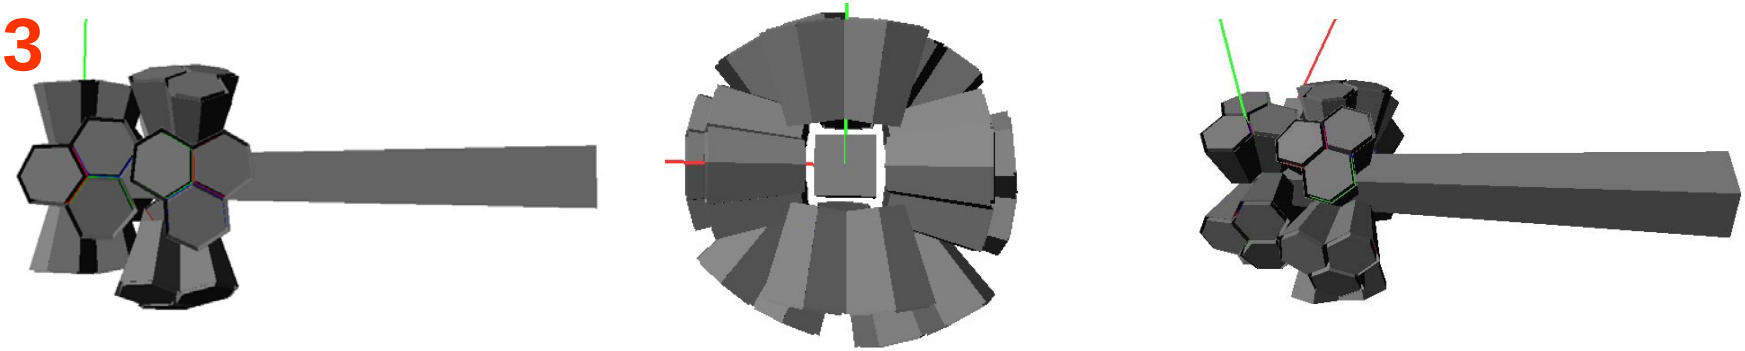
C1



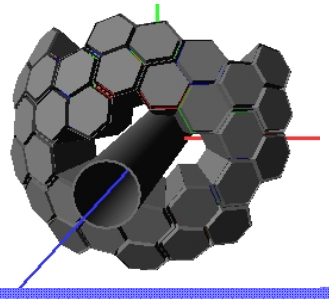
C2



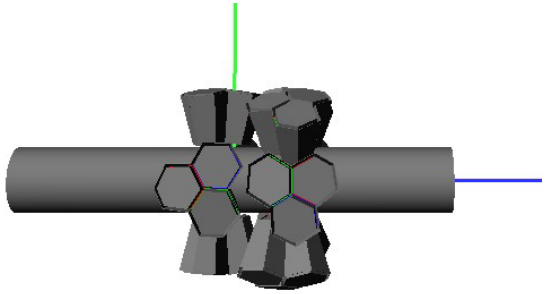
C3



Pros and Cons



- Good resolution
- Tracking between clusters
- Conventional mechanics (LNL)



- High efficiency
- γ–γ efficiency
- Larger angular range

- Lower efficiency
- Small solid angle (angular std.)

- Lower resolution
- No tracking between clusters
- New mechanics

Outline

- Particular constraints for the setup at GSI
- Geometries: shell and compact setups
- Performance comparison
- Viability of additional γ-ray detectors: RISING, HECTOR, etc
- Gain in performance from 10 to 12 Clusters
- Outlook and conclusion

Performance comparison: general aspects

- Systematic study of efficiency and resolution vs. distance for all geometries

- "Reference physics case": (GEANT4 AGATA code from E.Farnea et al.)
  - ➡ $E_{\gamma,o}$ = 1 MeV, recoil nucleus at β = 0.43 (E = 100 MeV/u), Mγ = 1
  - ➡ Systematic study several distances sec. target – detector

  - ➡ GSI FRS Spatial Beam Profile FWHM_x = 6 cm FWHM_y = 4 cm

Active target
DSSSD

C2 + 2 Clusters

Outline

- Particular constraints for the setup at GSI
- Geometries: shell and compact setups
- Performance comparison
- Viability of additional γ-ray detectors: RISING, HECTOR, etc
- Gain in performance from 10 to 12 Clusters
- Outlook and conclusion

Outlook and conclusion

1. There are two geometry options (S3 and C2) which show an enormous boost in performance when compared to RISING, thus increasing the γ-ray sensitivity by about one order of magnitude in both cases.
2. The compact version C2 shows substantially higher efficiency (16.7%) compared to the S3 shell geometry (13.6%).
   (Absolute difference 3.1%, relative difference 23%.)
3. The $\gamma\gamma$-sensitivity of the C2 geometry is 1.5 times larger than that of the S3 shell.
   (In Rising units, 60 and 40, respectively.)
4. The energy resolution of the C2 geometry is slightly worse (0.3 keV higher) than that of S3.
   (The values for the ref. case simulated are 10.6 keV and 10.3 keV, respectively.)
5. The angular range covered by C2 is about 20deg larger than that of S3.
   (S3 covers from 35deg to 90deg, C2 covers from 25deg to 105deg).
6. From the technical point of view, S3 requires a smaller beam pipe (about 11 cm diameter). C2 is compatible with the GSI standard pipe of 16cm.

List of Tasks for the **Working Group (17.07.2009)**

Geometry cases

- Task 1: S2 + 5 Double Cluster detectors closing part of the central hole (15-16cm?). Remains shell with 5 crystals hole + pentagon hole
- Task 2: S3 + 1 Double Cluster detector closing part of the central hole (10-11 cm?). Remains shell with 4 crystals hole + pentagon hole.
- Task 3: previous + 4 Triple Clusters enlarging shell (for case one has 15 Clusters available).
- Task 4: C2 geometry, with clusters in 2nd ring pointing to target, and 3rd ring (15 Clusters total)

Physics cases evaluate realistically the performance of the optimal detection system in:

- Task 1: Coulex experiment. Example: Coulex of 104Sn at 100 MeV/u on a 0.4 g/cm2 Au-target. Primary beam 124Xe.
- Task 2: Fragmentation experiment. 54Ni at 100 MeV/u + Be (0.7 g/cm2) -> 50Fe (simulate first 4 excited states up to 8+ level).
- Task 3: Plunger experiment (A. Dewald, Chr. Fransen Uni. Koeln). Enfasis on angular distribution and contribution of RISING at forward angles

Realistic implementation

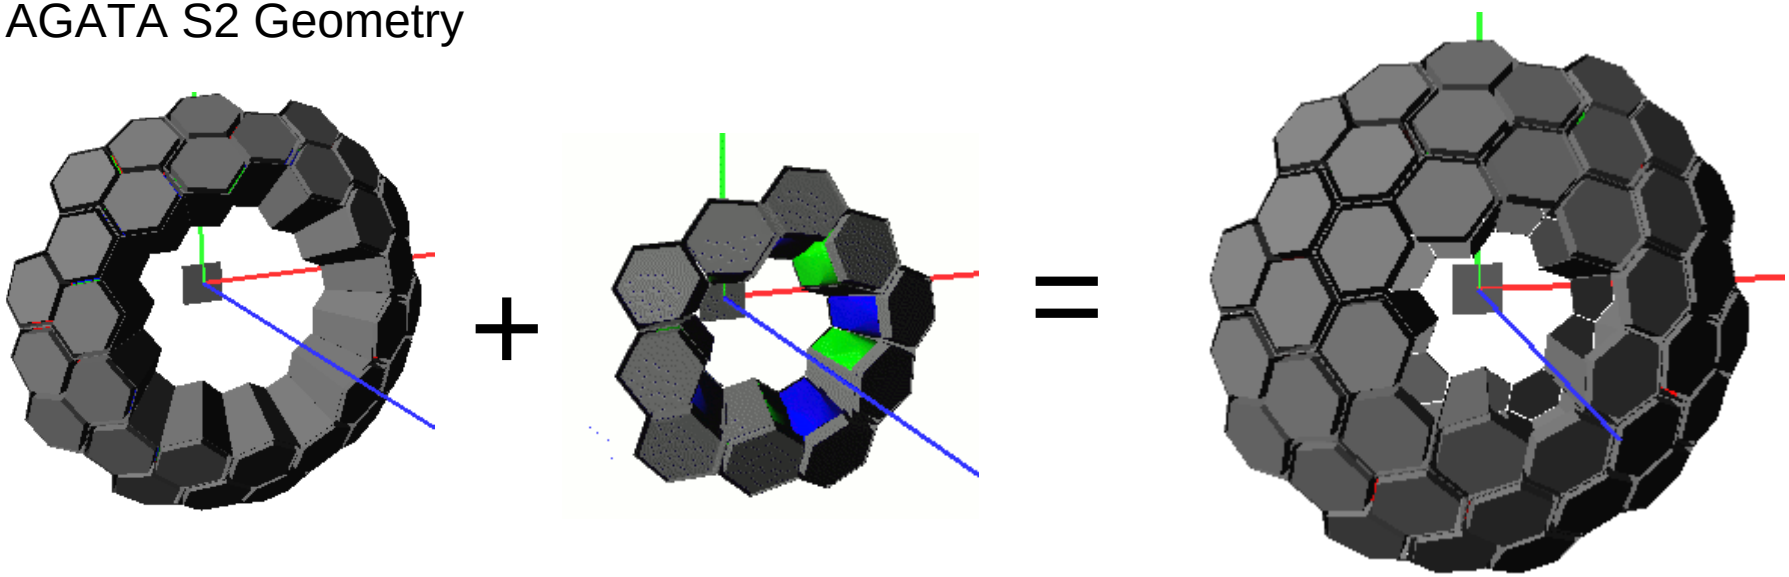
- Task 1: Background model or scaled background spectra from prev. experiments
- Task 2: Realistic tracking for event reconstruction (mgt, etc)

New results: AGATA S2 + Agata Double Cluster Array (ADCA)

Geometry cases

- Task 1: S2 + 5 Double Cluster detectors closing part of the central hole (15-16cm?). Remains shell with 5 crystals hole + pentagon hole

AGATA S2 Geometry

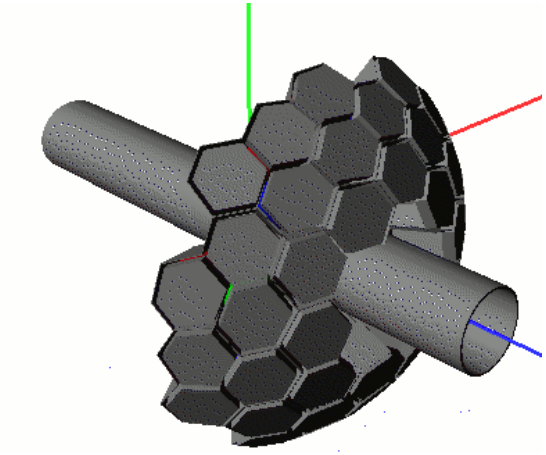


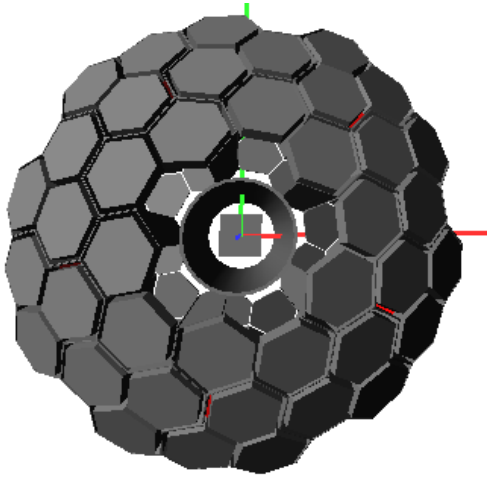
10 triple Cluster + **5 double** Cluster

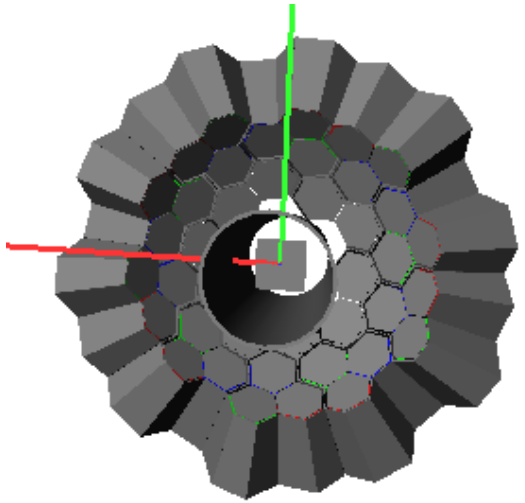
New results: AGATA S2 + Agata Double Cluster Array (ADCA)

Geometry cases

- Task 1: S2 + 5 Double Cluster detectors closing part of the central hole (15-16cm?). Remains shell with 5 crystals hole + pentagon hole





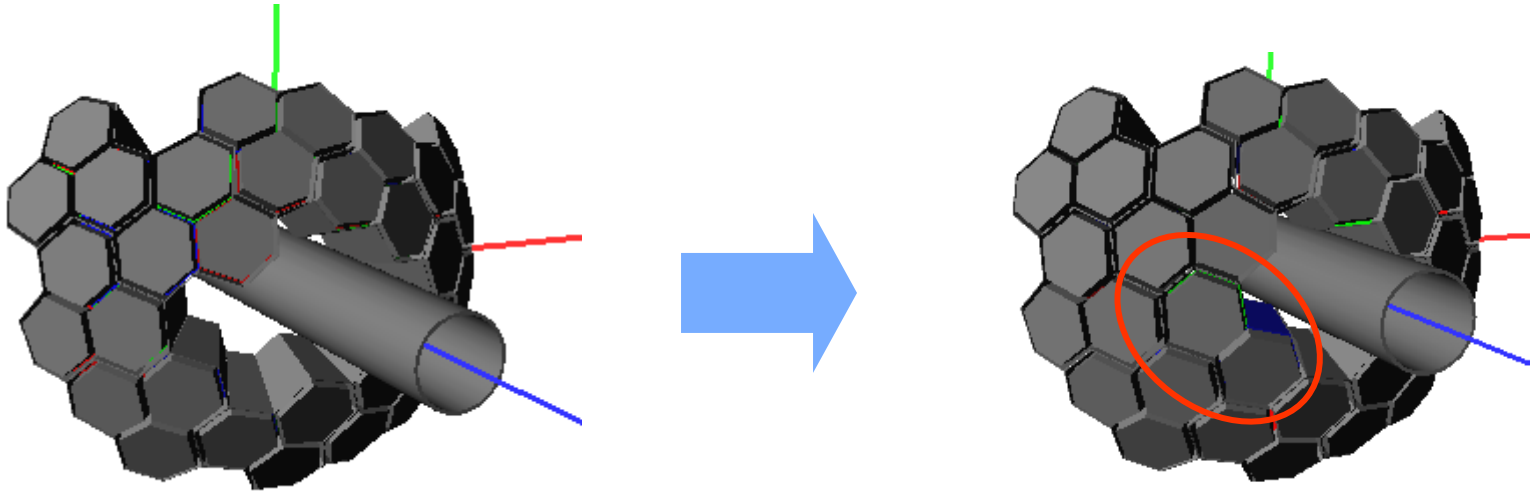


Beam pipe diameter = 13 cm

New results: AGATA S3 + 1 Agata Double Cluster

Geometry cases

- Task 1: S2 + 5 Double Cluster detectors closing part of the central hole (15-16cm?). Remains shell with 5 crystals hole + pentagon hole
- Task 2: S3 + 1 Double Cluster detector closing part of the central hole (10-11 cm?). Remains shell with 4 crystals hole + pentagon hole.



10 triple Cluster (Asym) + **1 double** Cluster

Beam pipe diameter = 11 cm

List of Tasks for the **Working Group (17.07.2009)**

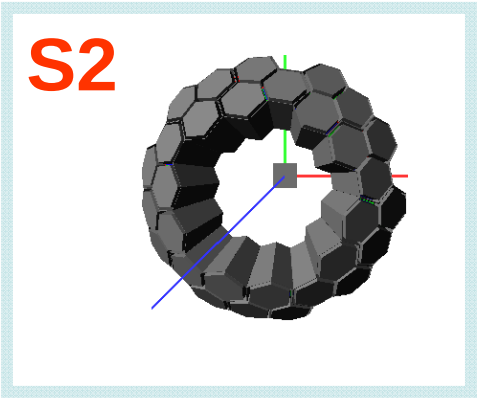
Geometry cases

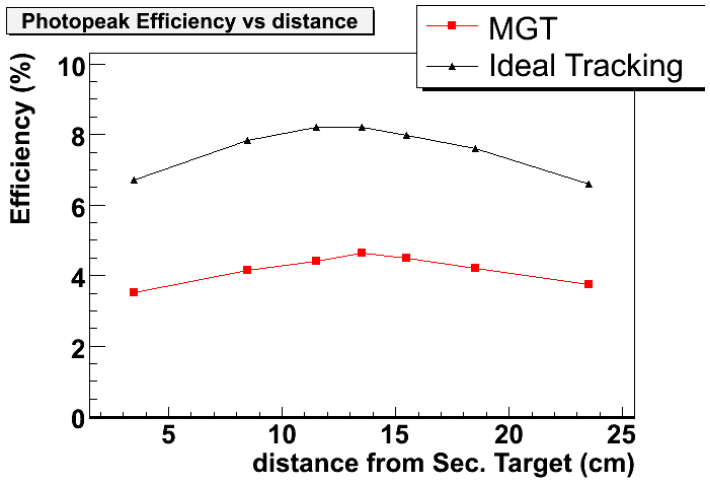
- Task 1: S2 + 5 Double Cluster detectors closing part of the central hole (15-16cm?). Remains shell with 5 crystals hole + pentagon hole
- Task 2: S3 + 1 Double Cluster detector closing part of the central hole (10-11 cm?). Remains shell with 4 crystals hole + pentagon hole.
- Task 3: previous + 4 Triple Clusters enlarging shell (for case one has 15 Clusters available).
- Task 4: C2 geometry, with clusters in 2nd ring pointing to target, and 3rd ring (15 Clusters total)

Conclusion:

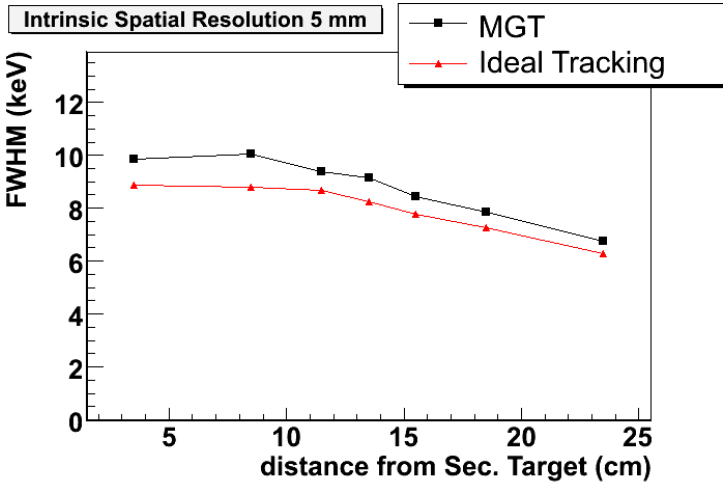
- Provided that 10 ATC detectors and 1 “ADC” detector (or more) are available, then a shell geometry (S3’ or S2’) shows a superior performance than any other possible cylindrical geometry (e.g. C2).
- Typical γ-ray efficiencies between 14% and 17% can be achieved, which in combination with resolutions (FWHM) of 8-9 keV will provide a γ-ray sensitivity of more than 10 times the RISING sensitivity.

Realistic Tracking (mgt)





50% lower efficiency



10% worse resolution

List of Tasks for the **Working Group (17.07.2009)**

Geometry cases

- Task 1: S2 + 5 Double Cluster detectors closing part of the central hole (15-16cm?). Remains shell with 5 crystals hole + pentagon hole
- Task 2: S3 + 1 Double Cluster detector closing part of the central hole (10-11 cm?). Remains shell with 4 crystals hole + pentagon hole.
- Task 3: previous + 4 Triple Clusters enlarging shell (for case one has 15 Clusters available).
- Task 4: C2 geometry, with clusters in 2nd ring pointing to target, and 3rd ring (15 Clusters total)

Conclusion:

- Provided that 10 ATC detectors and 1 “ADC” detector (or more) are available, then a shell geometry (S3’ or S2’) shows a superior performance than any other possible cylindrical geometry (e.g. C2).
- REALISTIC γ-ray efficiencies between 7% and 9% can be achieved, which in combination with resolutions (FWHM) of 9-10 keV will provide a γ-ray sensitivity of more than 5 times the RISING sensitivity.

Detector response function (by hand):

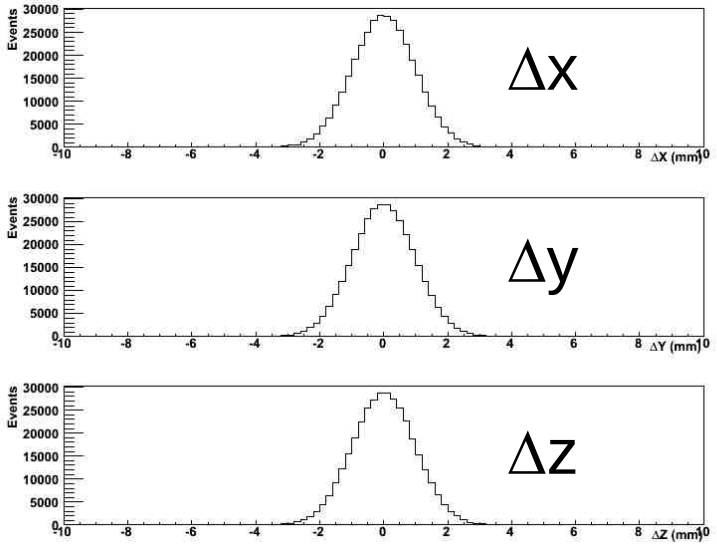
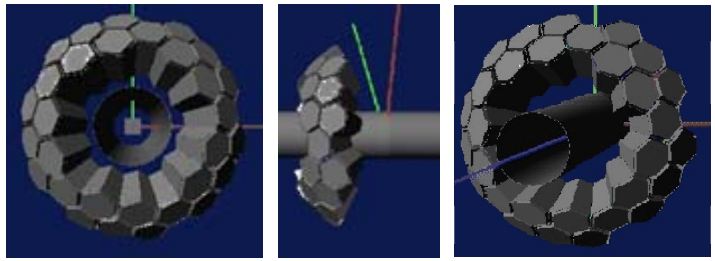
Intrinsic spatial resolution: x, y, z folded with a Gauss distribution to introduce spatial resolution of 2-5 mm FWHM

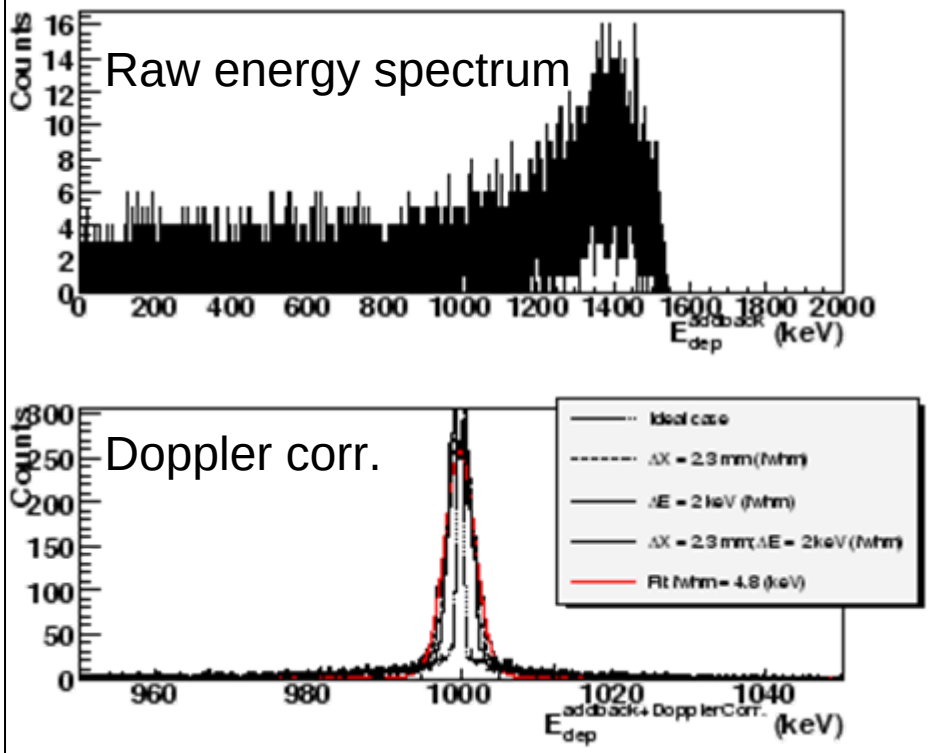


General aspects: event reconstruction (example)



Setup geometry
Primary events,
(e.g. 1 MeV g-ray @ b = 50%)

d = 23.5 cm



$$E_{\gamma o} = E_{\gamma} \frac{1-\beta\cos\vartheta_{\gamma}}{\sqrt{1-\beta^2}}$$

ΔE = 2 keV (fwhm) @ Eγ = 1 MeV; Δx = 4 mm

Outline

1. Basics: MC code & event reconstruction
2. Cross check of the results
3. Particular constraints for the setup at GSI
4. Geometries: shell and compact setups
5. Performance comparison
6. Viability of additional γ-ray detectors: RISING, HECTOR, etc
7. Gain in performance from 10 to 12 Clusters
8. Outlook and conclusion

Validation analysis / event reconstruction

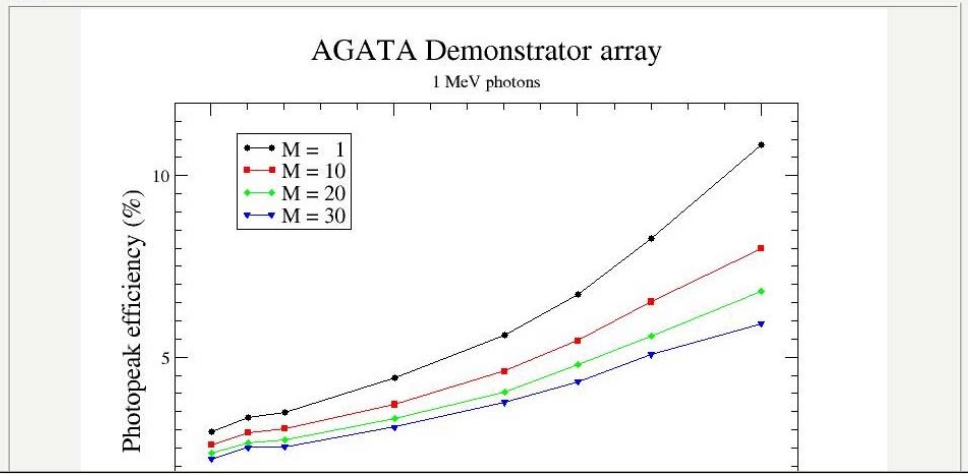
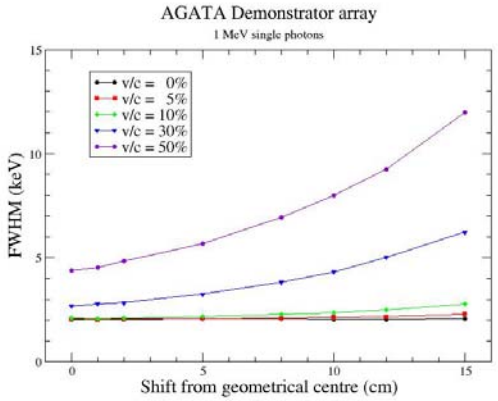
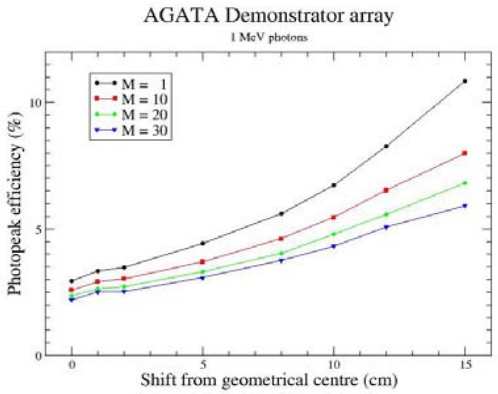
Last updated: November 8th 2005

The AGATA Demonstrator

The AGATA Demonstrator Array is an arrangement of five triple clusters of the same kind which will be used to form the final A180 Configuration of AGATA. The performance of such an object will depend in a critical way on its placement relative to the target position. In particular, given the lack of a spherical symmetry, it is sensible to place the detectors closer to the target position compared to the "reference" distance being the target-detector distance of the full A180 Configuration, that is, 23.5 cm. The photopeak efficiency and the P/T ratio as a function of the shift from the geometrical centre are shown in the following plots, where it is assumed that 1 MeV photons are emitted from a point source at rest in the Laboratory reference frame:







Validation analysis / event reconstruction

Solid symbols: analysis GSI

AGATA Geometry @ GSI

Other aspects

- Background
  - Atomic background (bremsstrahlung) ⇒ Shielding + P. Detistov work
  - Neutron induced background ⇒ Nothing
  - Scatt. Particle background ⇒ Tests October ’09

- Mechanical constraints (holding structure)

- Technical constraints (square beam pipe, cylindrical pipe smallest size compatibel with DSSSD Sec. Target, No Chamber ?)

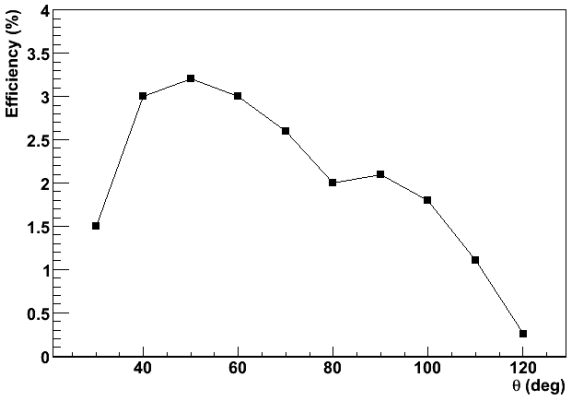
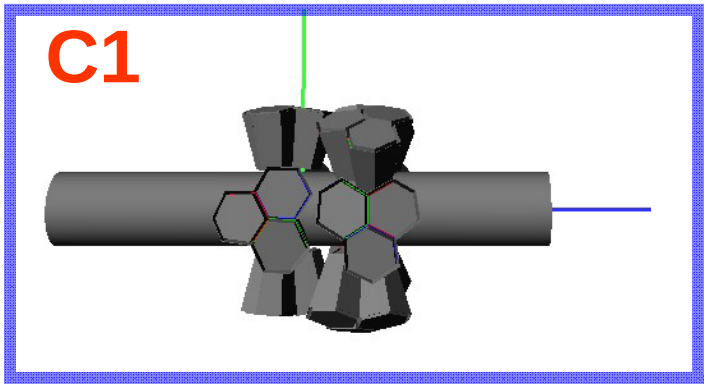
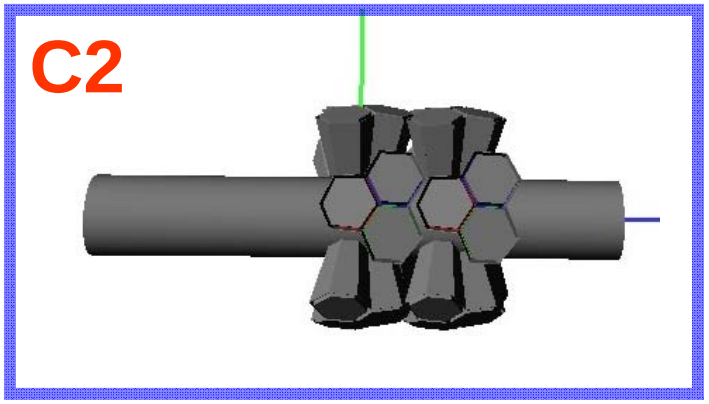
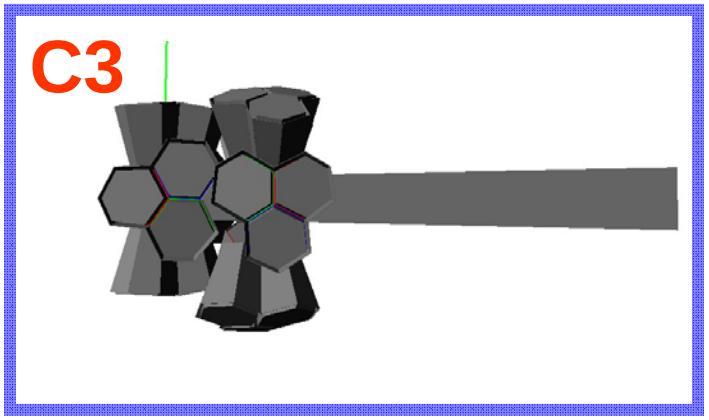
C3

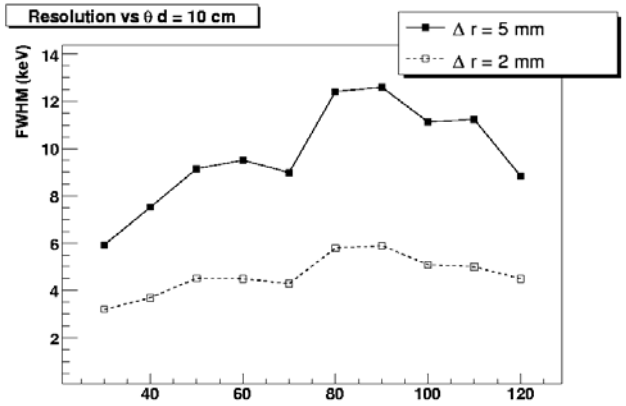


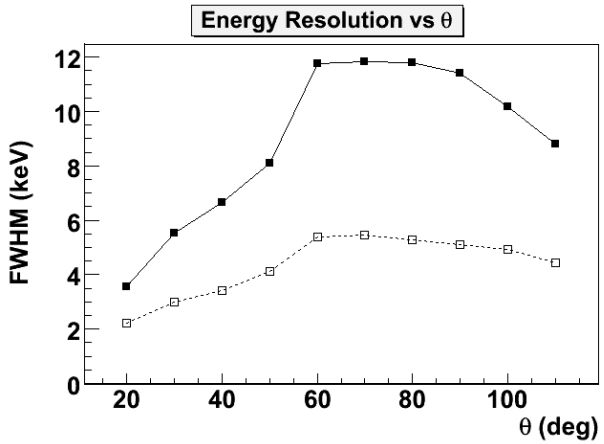
AGATA Geometry @ GSI θ–Diff. Energy Resolution

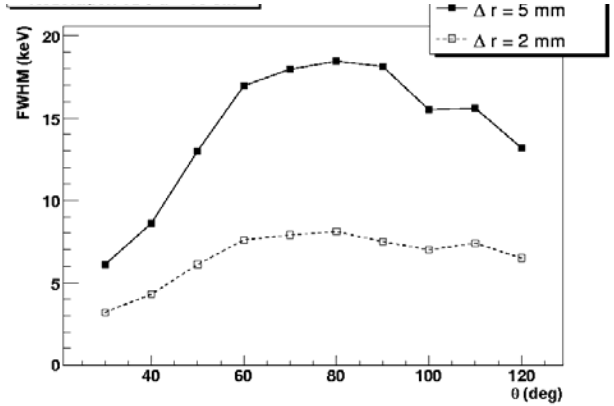






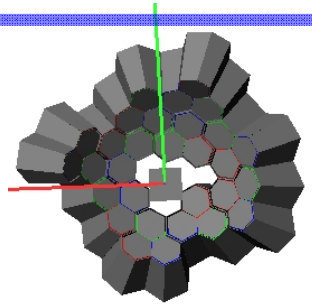






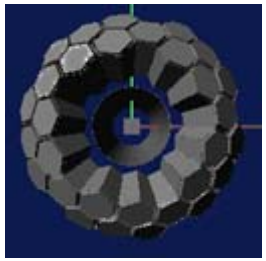
S- and C-Geometries, Optimal Distances

S1



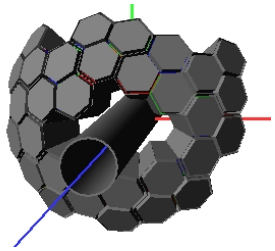
d = 23.5 – 15 = 8.5 cm

S2



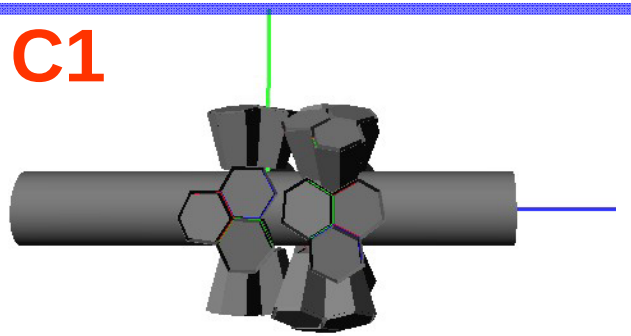
d = 23.5 – 10 = 13.5 cm

S3

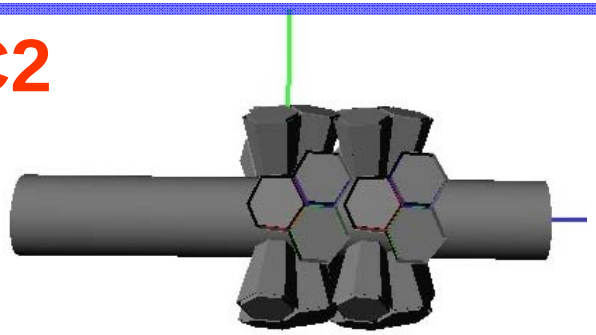


d = 23.5 – 15 = 8.5 cm

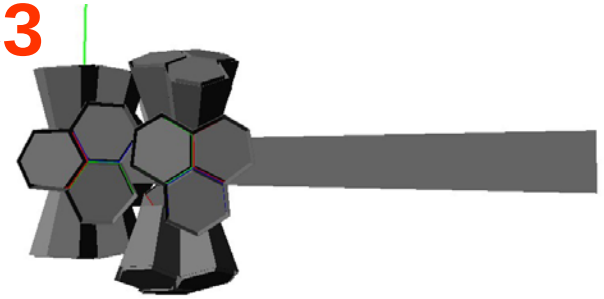
C1



C2

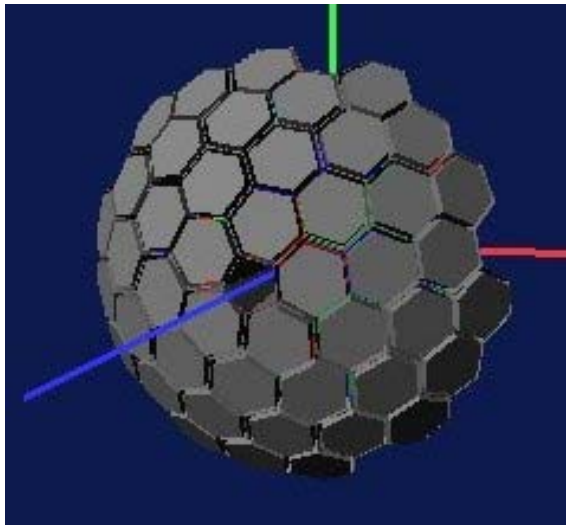


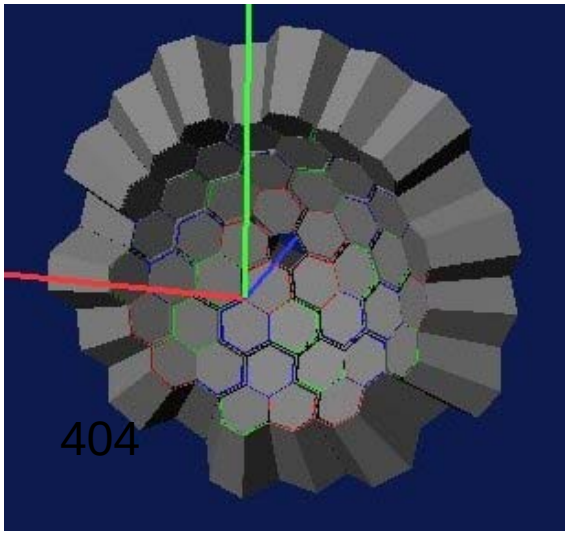
C3



Stepwise geometry optimisation

- Ideal geometry = first approach, first step





- two main dissadvantages:

1. 15 cluster detectors will not be available yet in 2011/2012
2. The beam hole (pentagonal hole) is too narrow for the GSI beam size

- Geometry constraint: triple clusters (not individual crystals)

List of Tasks for the **Working Group (17.07.2009)**

Geometry cases

- Task 1: S2 + 5 Double Cluster detectors closing part of the central hole (15-16cm?). Remains shell with 5 crystals hole + pentagon hole
- Task 2: S3 + 1 Double Cluster detector closing part of the central hole (10-11 cm?). Remains shell with 4 crystals hole + pentagon hole.
- Task 3: previous + 4 Triple Clusters enlarging shell (for case one has 15 Clusters available).
- Task 4: C2 geometry, with clusters in 2nd ring pointing to target, and 3rd ring (15 Clusters total)

Physics cases evaluate realistically the performance of the optimal detection system in:

- Task 1: Coulex experiment. Example: Coulex of 104Sn at 100 MeV/u on a 0.4 g/cm2 Au-target. Primary beam 124Xe.
- Task 2: Fragmentation experiment. 54Ni at 100 MeV/u + Be (0.7 g/cm2) -> 50Fe (simulate first 4 excited states up to 8+ level).
- Task 3: Plunger experiment (A. Dewald, Chr. Fransen Uni. Koeln). Enfasis on angular distribution and contribution of RISING at forward angles

Realistic implementation

- Task 1: Background model or scaled background spectra from prev. experiments
- Task 2: Realistic tracking for event reconstruction (mgt, etc)
